

# Closed-Cycle Wet Cooling

{ ASME-IMECE Congress NSF-EPRI Workshop 11/13/2012  
By: Jean-Pierre Libert

- &Heat generated in power plants must be dissipated.
- &Natural bodies of water cannot sustain unlimited amounts of heat.

# Introduction

& The Clean Water Act (CWA) establishes the basic structure for regulating discharges of pollutants into the waters of the United States and regulating quality standards for surface waters

# Clean Water Act

& As authorized by the CWA, the National Pollutant Discharge Elimination System (NPDES) permit program controls water pollution by regulating point sources that discharge pollutants into waters of the United States

# NPDES

⌘ Section 316(b) of the CWA requires that NPDES permits for facilities with cooling water intake structures ensure that the location, design, construction and capacity of the structures reflect the best technology available to minimize harmful impacts on the environment.

## CWA Section 316(b)

- ⌘ Indirect Cooling: surface condenser + ...
  - ⌘ Once-through
  - ⌘ Once-through with helper cooling tower
  - ⌘ Wet or wet-dry cooling tower
  - ⌘ Dry air cooler
  - ⌘ Heller System (DC condenser)

# Indirect Cooling

## & Direct Condensing

- ∅ Air Cooled Steam Condenser (ACC)

## & Parallel Condensing (PCS)

- ACC in parallel with Cooling Tower + Surface Condenser

# Direct Condensing or PCS

- ⌘ Indirect wet (or wet-dry) cooling or direct condensing will eventually replace once-through.
- ⌘ Water availability in many regions is becoming more restricted.
- ⌘ Water cost on the rise everywhere.
- ⌘ Evaluate direct condensing vs. indirect wet or wet-dry cooling systems.

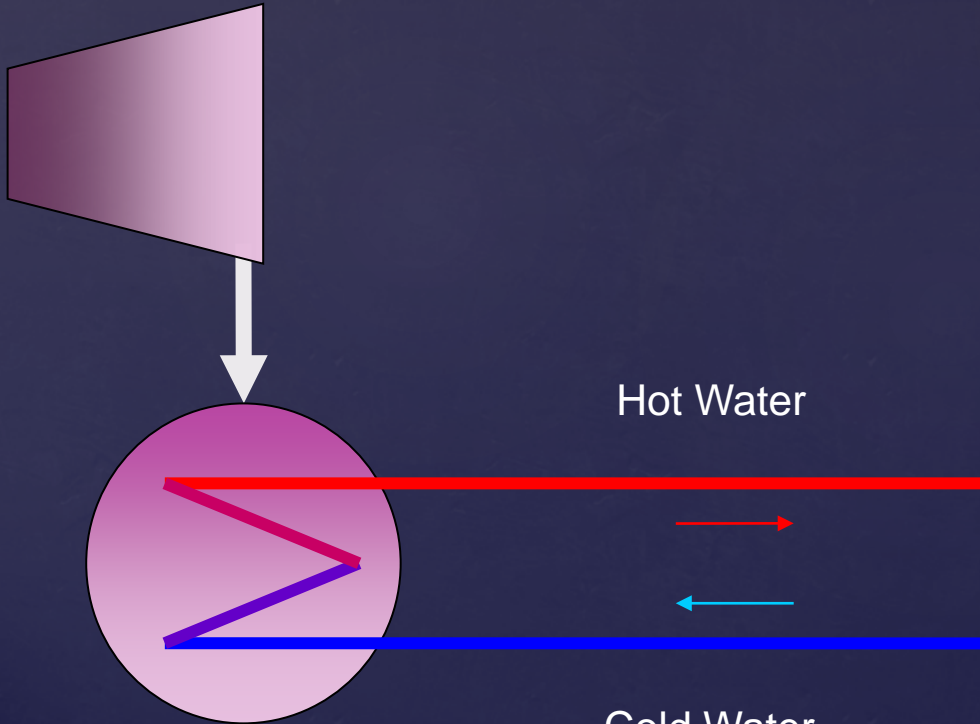

# The future?

# Indirect Wet or Wet-Dry Cooling

# Once-Through

# Closed Cycle Wet Cooling (ND)

# Closed Cycle Dry Cooling (MD)

# Dry Cooling Heller System

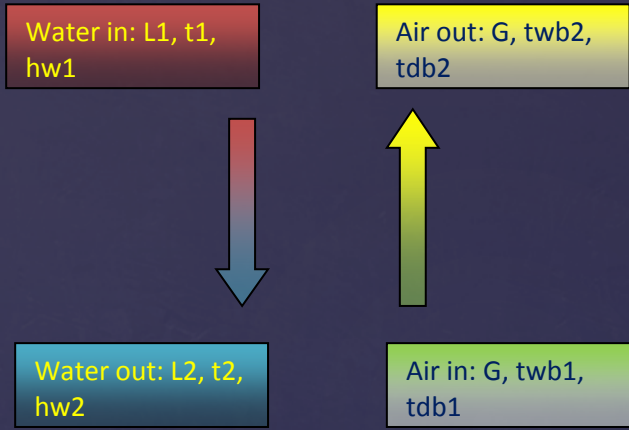

**Рис. 2:** Принципиальная схема системы Геллера со смешивающим конденсатором.

**Fig. 2:** Simplified flow diagram of HELLER System with DC Condenser

- ⌘ Wet cooling systems produce a lower turbine backpressure than dry cooling systems so the turbine operates at higher efficiency, but...
- ⌘ Wet cooling systems do consume water.

# Energy-Water Nexus

⌘ Heat Balance:

$$\text{⌘ } cp L_1 t_1 - cp L_2 t_2 = G ha_2 - G ha_1$$

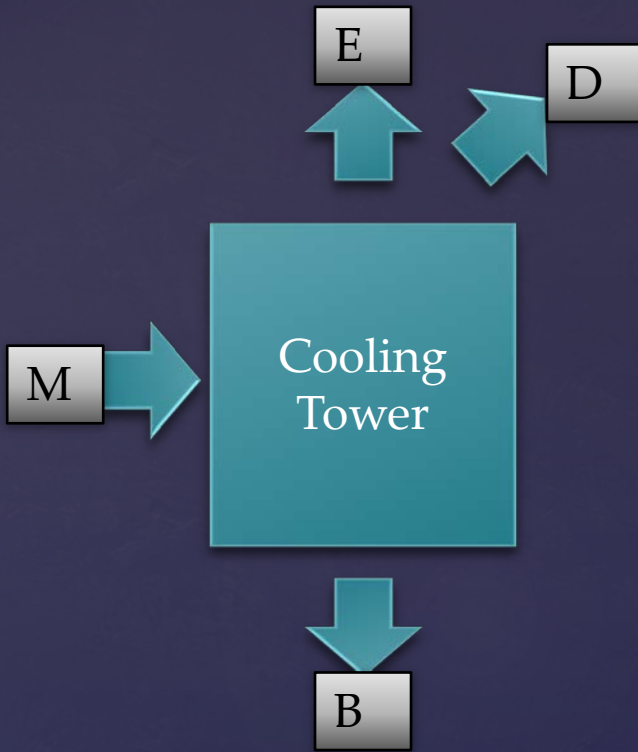

⌘ Mass Balance:

$$\text{⌘ } L_1 - L_2 = G (w_2 - w_1)$$

$$\text{⌘ } \text{Evaporation} = G (w_2 - w_1)$$

$$\text{⌘ } \text{Evaporation \%} = G/L_1 (w_2 - w_1)$$

# Thermodynamics of Wet Cooling

- & Makeup = M
- & Evaporation = E
- & Bleed = B
- & Drift = D
- &  $M = E + B + D$
- & Cycles of Concentration = CC
- &  $CC = M / B$
- &  $M = CC / (CC - 1) \times (E + D)$

# Water Consumption

## EVAPORATION VS. WET BULB TEMPERATURE

SHOWING ARRAY OF INLET RELATIVE HUMIDITIES AT 100% FLOW AND 100% RANGE

**Project: ASME NSF-EPRI workshop**

Selection: 01 (JRL)

Design Conditions:

Water Flow Rate: 300,000 [GPM]

Barom. Pressure: 29.92 [inHg]

Geometry: 20 Cell 54x48 [ft]

Fan Power (AMS): 236.0 [HP]

Fill: 5.00[ft] TechClean 214 (11/11)

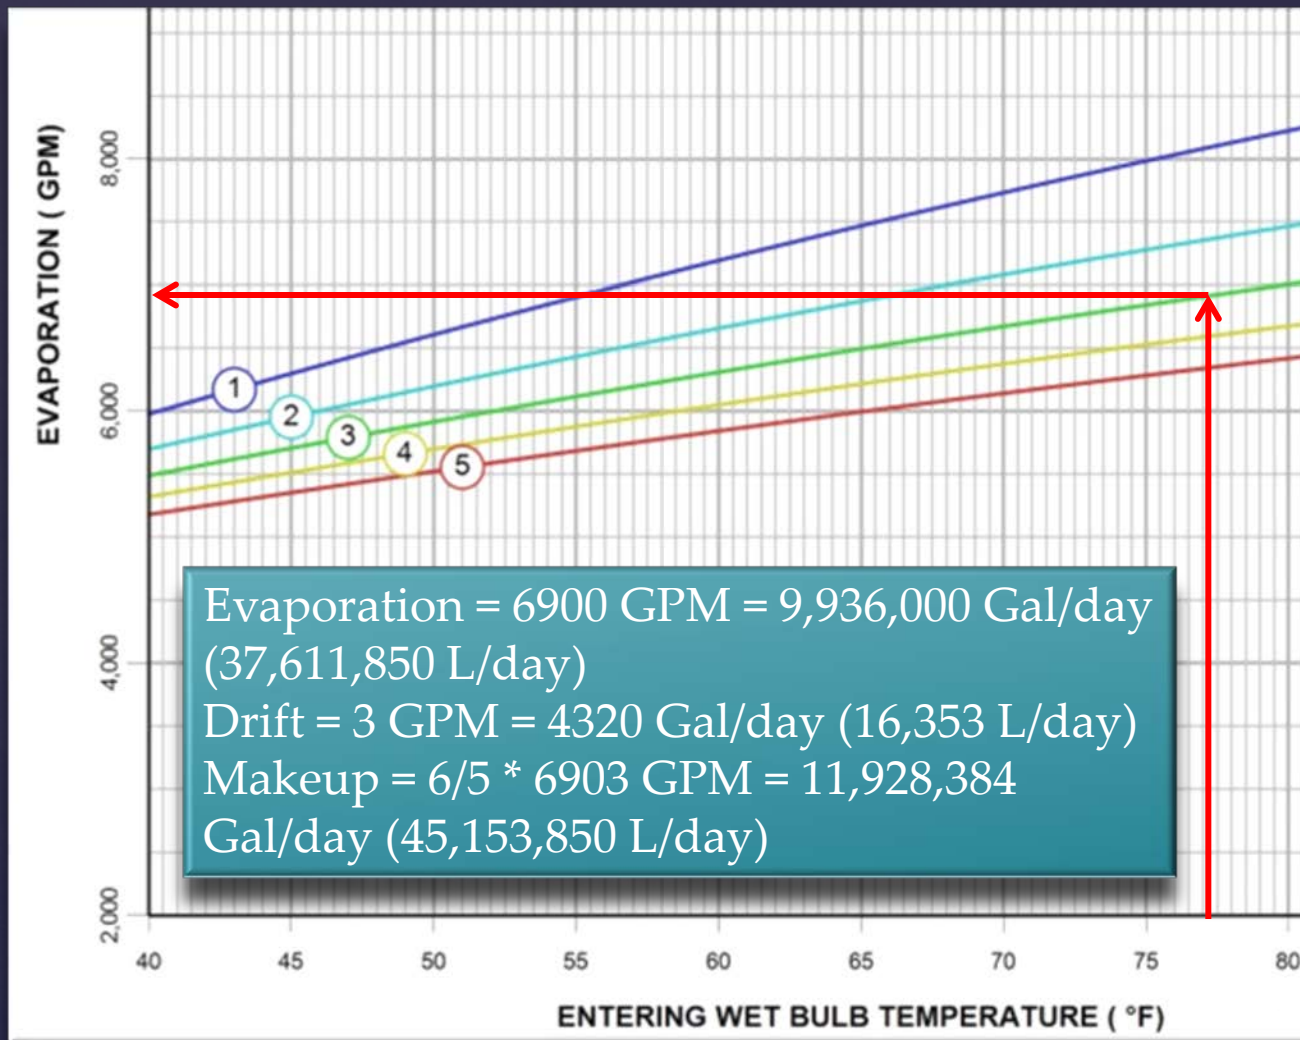

Design L/G: 1.267

HW/CW/WB/RH: 113.00/86.00/77.00 [°F]/ 60.0%

- (1) 20.0% RH
- (2) 40.0% RH
- (3) 60.0% RH
- (4) 80.0% RH
- (5) 100.0% RH
